

## Part 1

After practicing adb commands from the posted Notes, **sequentially** run appropriate commands to satisfy the following requirements (copy the commands you use and the output they produce from your console into a .txt file to submit your HW for review).

1. Start an emulator from command line (if you have a physical device, **in addition**, connect your phone/tablet with USB); hint: once it is started, open a new terminal or command prompt window to proceed
2. Display the list of currently connected devices
3. Install .apk file on the emulator using an appropriate command redirection option
4. Install .apk file on the device connected with USB using an appropriate command redirection option (**for those who don't have physical device**: still run the command and copy a console output; once you get the output, use Ctrl+C - Mac and Windows - to continue)
5. Re-install .apk file on the emulator using serial number as command redirection option
6. Using adb, take a screenshot and pull it onto your computer's Desktop
7. Using adb, record a 30-second video (use TIME option as explained in Notes) and pull it onto your computer's Desktop
8. Push a .png file from your computer to the emulator's sdcard
9. Collect the log for **test** version of Dabbl filtering by the word 'adjoy', you command Uninstall .apk from the emulator (and the physical device if it has been used)
10. Research what adb command reboots the device and reboot it

## Part 2

Complete quiz.
