# MOBILE APPS: Types

Tree basic types of "app"

Native

*Built specifically to the needs of the various operating systems such as Apple's iOS or Android*

Web

*Websites built using HTML that are designed specifically for smaller screens*

Hybrid

*Native app shell with feeds from the website*

# MOBILE APPS: Native APP

Written using the default language for the mobile platform, which is Objective C or Swift for iOS and Java for Android.

Compiled and executed directly on the device.

Using the platform SDK (API), the app can communicate with the platform to access device data or load data from an external website using http requests.

# MOBILE APPS: Native APP

## PROS

Native APIs

Performance

Same environment

## CONS

Language requirements

Not cross platform

High level of effort

# MOBILE APPS: WEB APP

Mobile websites are applications that work well on a mobile device, but are accessed through the mobile browser.

These websites viewed on a mobile device in a mobile browser, with the exception of being designed to fit a mobile device screen size.

Responsive web design can be used to make a web application - whether a conventional web site or a single-page application viewable on small screens and work well with touchscreens.

# MOBILE APPS: WEB APP

## PROS

Maintainability

No  
installation.

Cross platform.

## CONS

No native access

Requires  
keyboard to load

Limited user  
interface.

# MOBILE APPS: HYBRID APP

A hybrid app is one that combines elements of both native and Web applications

Hybrid apps are often mentioned in the context of mobile computing

For the most part, hybrid apps provide the best of both worlds

# MOBILE APPS: HYBRID APP

## PROS

Cross platform

Same skills as  
web development

Access to device

Ease of  
development

## CONS

Web view  
limitations

Native via  
plugins

No native user  
interface controls

Experienced  
developers

# MOBILE APPS: SUMMARY

## Native Mobile App

- iOS - Developed using Objective-c
- Android - Developed using JAVA
- Need to Install from APP Store.
- Available as an Application on Device.

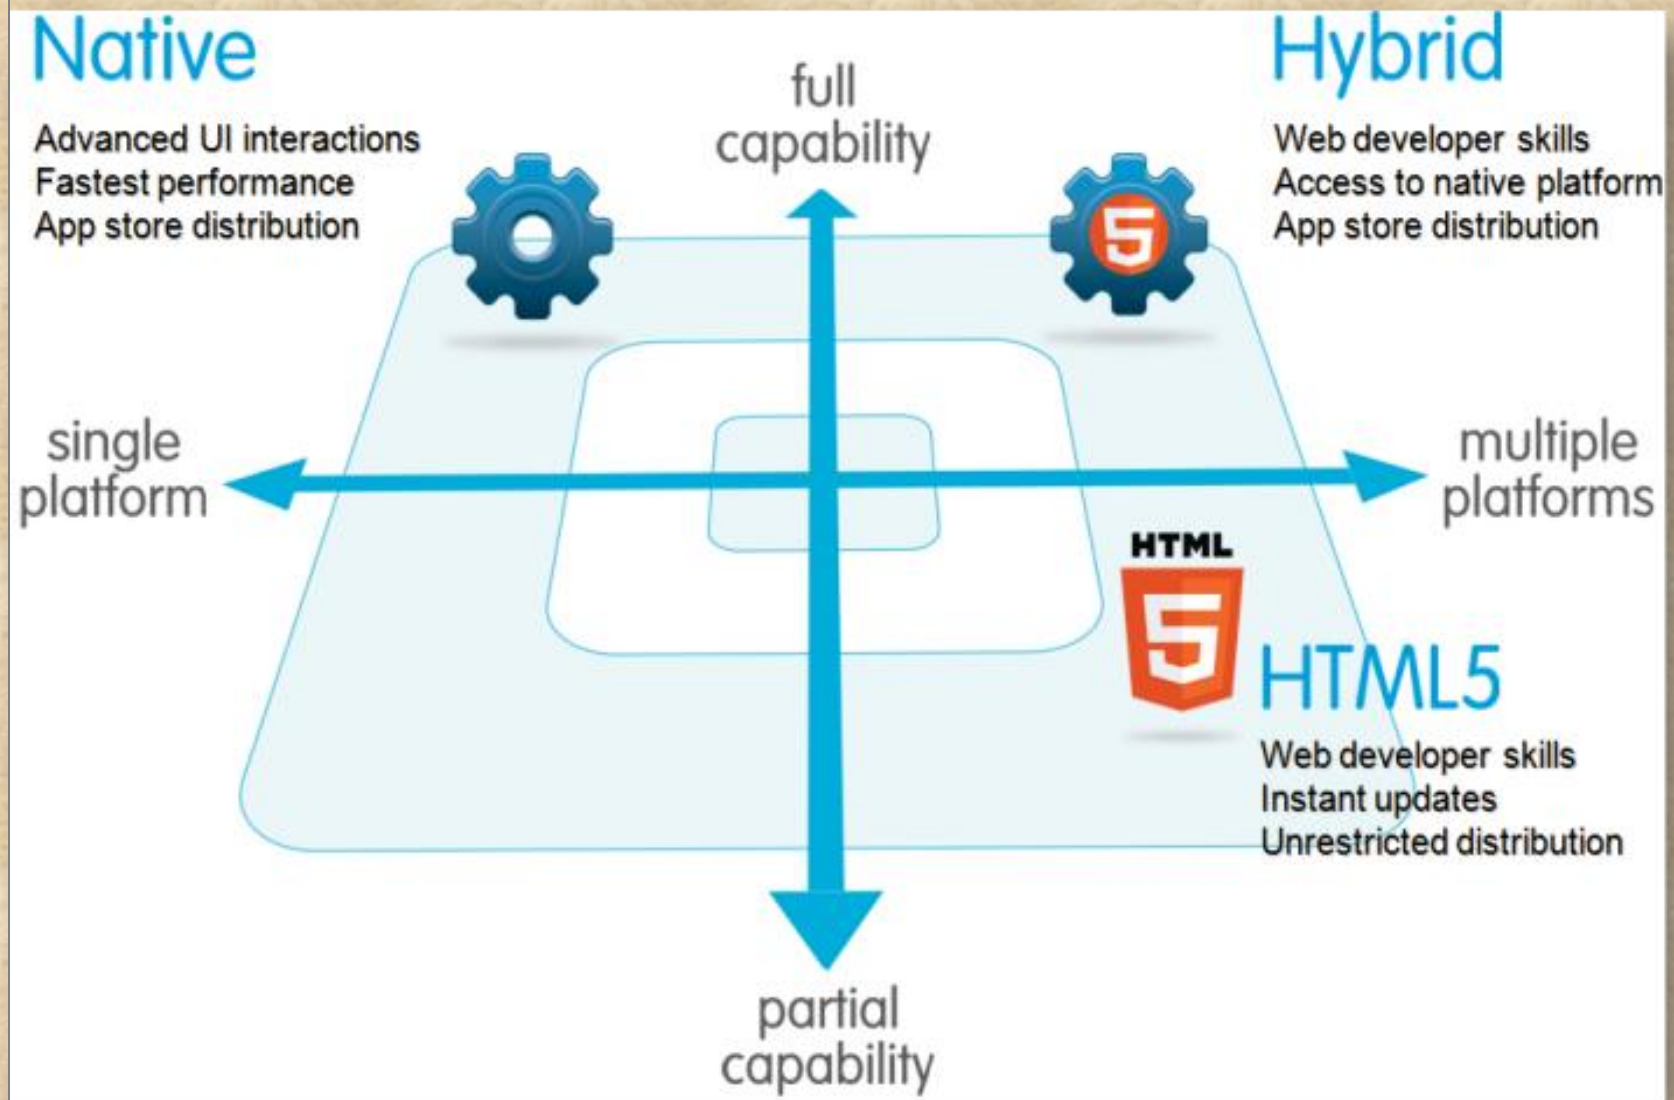

## Mobile Web App

- Developed using typical web development technology - HTML, CSS, Java Script.
- View size of the Web page fit to the real-estate of the device.
- Accessed through the browsers on the device

## Hybrid Mobile App

- Wrapping the HTML and creating Native like look and feel (HTML within the app itself). Framework like Phone Gap support this development.
- Native Mobile App with Web view control and render the HTML directly on the web view (HTML Rendered from enterprise server).
- View size of the Web page fit to the real-estate of the device.
- Accessed through the browsers on the device

# MOBILE APP types COMPARISSION

# Mobile APPS : Conclusion

LIST	Native	HTML5	Hybrid
<b>App Features</b>			
Graphics	<i>Native APIs</i>	<i>HTML, Canvas, SVG</i>	<i>HTML, Canvas, SVG</i>
Performance	<i>Fast</i>	<i>Slow</i>	<i>Slow</i>
Native look and feel	<i>Native</i>	<i>Emulated</i>	<i>Emulated</i>
Distribution	<i>Appstore</i>	<i>Web</i>	<i>Appstore</i>
<b>Device Access</b>			
Camera	<i>Yes</i>	<i>No</i>	<i>Yes</i>

# Mobile APPS: **Distribution/Installation/Logs**

## How to enable Developers Options ?

1. Enable USB debugging in the device system settings, under **Developer options**.

2. To make it visible, go to **Settings > About phone** and tap **Build number seven times**.

3. Return to the previous screen to find **Developer options** at the bottom.

# Mobile APPS: *Distribution/Installation/Logs*

## ( contin.)How to enable Developers Options ?

Open Developers Options

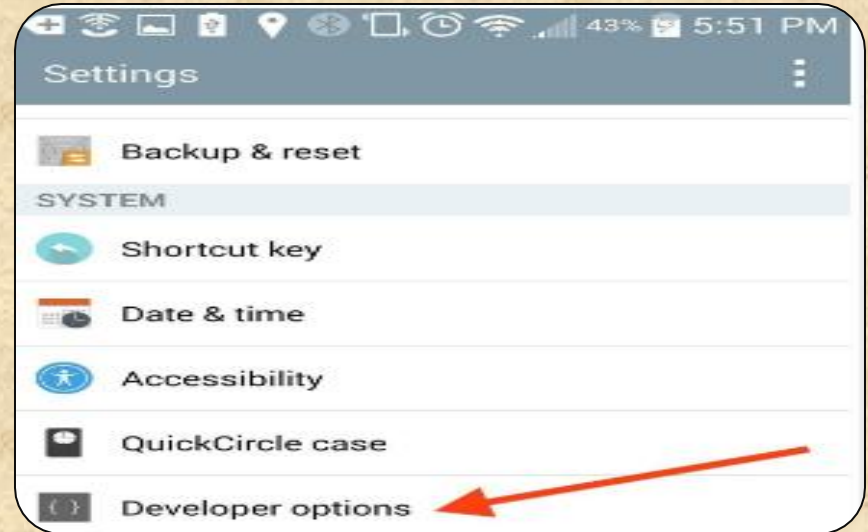

Check the box **USB debugging**.

This setting will allow you to connect your device to your computer, then issue **fastboot** commands via **ADB**.

This is useful for rooting, unlocking bootloaders, **installing recoveries**, and a ton more.

# Android Studio

Powered by IntelliJ Platform

# Mobile APPS: **Distribution/Installation: Android .APK**

What is  
Android Studio?

**Android Studio** is the official integrated development environment (IDE) for **Android** platform development.

The official language for Android development is **Java**. Large parts of Android are written in **Java** and its APIs are designed to be called primarily from **Java**.

It is possible to develop C and C++ apps using the Android Native Development Kit (NDK), however it isn't something that Google promotes.

## What is ADB in Android Studio

Android Debug Bridge (adb) is a versatile command line tool that lets you communicate with an emulator instance or connected Android-powered device.

It is a client-server program that includes three components:

A **client**, which sends commands. The client runs on your development machine. You can invoke a client from a shell by issuing an adb command. Other Android tools such as DDMS also create adb clients.

A **daemon**, which runs commands on a device. The daemon runs as a background process on each emulator or device instance.

A **server**, which manages communication between the client and the daemon. The server runs as a background process on your development machine.
